Introduction

In this lab we will show that the integration of Workforce AI into the firewall as part of the AI Network Firewall concept will allow customers to prevent employees from releasing corporate data to AI companies.

The required components of the lab environment are:

- A client PC from which we will access AI services and generate the traffic.
- A Check Point firewall with AI Network Firewall features enabled, with its associated management server and admin workstation.
- A Check Point portal tenant account (you will create this during the lab).

The exercises will prove that the Workforce AI feature can block specific types of data being sent to SaaS AI services such as ChatGPT, Gemini and Claude.

Revision Control

Version	Date	Editor	Comments
0.1	01 Oct 2026	Andy Nicholson	Draft, incomplete.

Accessing the Lab

This lab is run in CloudShare. The instructor will provide access details by email.

Lab Topology

Insert here a diagram of the lab.

Credentials

Host/Software	Comment	Username	Password
HQ-Win10	Admin Workstation	admin	Cpwins1!
SmartConsole	On HQ-Win10	admin	vpn123
Branch-Win10	Test client	student@cp-demo	Cpwins1!

Initial Setup

No initial setup is needed as the lab environment is configured with a security policy we can begin from, and all required certificates are already installed.

Attendees will need to enable the required features and policy in order to configure the AI Network Firewall's Workforce AI feature.

Click on the Cloudshare link provided by your instructor. Go to the **HQ-win10** tab, click actions and **Send CTRL-ALT-DEL** then **Send Password**. Start SmartConsole and log in with **admin/vpn123**

Lab exercise 1: Connecting to the Check Point Portal

The Workforce AI Security feature on the firewall integrates with the AI Defense Plane running in the Check Point portal. In this exercise we will create a portal account, connect the lab's management server to the Portal, and enable the Workforce AI Security integration.

By the end of the exercise, you should understand how to create a portal account link on-premises management servers to the Portal.

1. Navigate to the Integration & Services tab in SmartConsole and click on the Register Now link to create a new portal account.

- a.
 2. Switch to the Firefox window on the Taskbar and fill in the details. Even if you already have a portal login, you can create a new tenant for this exercise. Use a descriptive name such as "Workforce-AI-test-2026-myname" or similar.
 - a. If you do have a Portal login already:
 - i. Ensure that your corporate policies allow you to log into it from a non-corporate device. If you can login from a non-corporate device, go to Step 2 "Creating a new tenant account with an existing Portal login"
 - ii. If you are prevented from accessing your portal account, go to Step 3 "Creating a new Portal login" and create a new account with a non-corporate email address that you have access to (follow the process below to do this).
 - b. If you do not have a Portal account, go to Step 3 "Creating a new Portal login".
 3. Creating a new tenant account with an existing Portal login.
 - a. Click the register now link and fill in the form using your existing email address, but set the account name to something descriptive such as "Workforce-AI-test-2026" or similar.

CREATE YOUR ACCOUNT

☒ I'm not a robot 

[Already registered? Sign In](#)

Next

- b.
- c. Log in.
- d. Skip to step 4 below "Creating the Trust between on-premises management server and the Check Point Portal."

4. Creating a new Portal login:

- i. Click on the register now link.

Next

- b.
- c. When you see the Account Created Successfully screen, click the Back to sign in link.

- d.
- e. Sign in using your credentials.

5. Creating the Trust between on-premises management server and the Check Point Portal.

- a. Return to SmartConsole and click on the Get Token button.
- b. Switch back to Firefox and log in, choose the account you just created, and click Next.
- c. Select the Checkbox to link your Self-hosted SMS to the portal and click Next.
- d. Click COPY TOKEN and return to SmartConsole, then paste in the token.
- e. Move the Connect your Security Gateways to Check Point Portal slider to ON, ensure that below in the Gateways Connection Details section, the All option is selected, and that in the Establish connection to Security Gateways, the Immediately option is selected.

- f.
- g. Click Connect.
- h. You should now be presented with a screen like the below screenshot. Notice the highlighted areas.

- i.
- j. In the Workforce AI Security tile, click Set Up, then click I Agree on the popup.

Exercise 1 is now complete. The Check Point portal login and tenant have been created, and the lab's management is linked to the new tenant.

Lab exercise 2: Enabling the Software Blades and features

The Workforce AI Security feature on the firewall requires supporting features to be enabled. Since most attendees will be familiar with management of Check Point firewalls, the following instructions are less detailed and will contain fewer screenshots. This provides an opportunity for attendees to think about how to achieve the goal, rather than being led step by step.

The Workforce AI Security feature uses HTTPS Inspection to provide visibility into encrypted sessions, and Application Control to recognise the AI traffic. Content Awareness recognises and extracts the prompt and sends the prompt data to the AI Defense Plane.

1. In SmartConsole, Edit the **branch-gw** firewall object and enable the required software blades:
 - a. Application Control
 - b. URL Filtering
 - c. Content Awareness
 - d. Workforce AI Security
2. Enable HTTPS Inspection as follows:
 - a. The certificates required for HTTPS Inspection are already created and trusted by the test client. Enable HTTPS Inspection with these settings:

- b.
- c. Click OK on the smaller popup then OK the branch-gw properties panel.
- d. Publish the changes and install the policy to activate the software blades.

Lab exercise 3: Setting Up the Policies

Now that the required framework is in place, we can proceed to setting up the Security Policy.

By the end of this exercise you should understand the required policy structure and be able to set a policy to prevent users from releasing confidential information such as corporate intellectual property or personally identifiable information to SaaS AI platforms.

1. Return to the **HQ-Win10** VM
2. In SmartConsole goto policy package AI-Network-Firewall. Find rule 10 in the Outbound section and change the action from Accept to be a new Inline layer. Name the layer something descriptive and enable the checkboxes for **Applications & URL Filtering** and for **Content Awareness**.

- a.
3. Publish and install the policy to make the Workforce AI objects available.
4. Adding the new rules to control use of AI:
 - a. Add a new rule above 10.1 to create our Workforce AI controls.
 - b. Copy the source and destination objects from rule 10 into the new rule 10.1.
5. In the Services & Applications column, choose **Workforce AI Supported App**.
6. In the Content column, add some data types. **Choose from the Workforce AI Data Types list.**
 - a. For the first test, chose **Source Code - Python**.
 - b. Once you have chosen the data types, set the direction to upload.
 - c. Leave the action set to drop and set the logging to Detailed or Extended. Accounting is not relevant for this test but leaving it on will do no harm.
7. Create another rule below this to allow other default services traffic to the Internet. Add the DNS service and the Web Browsing application objects to the Services & Applications column.
8. The inline policy for Workforce AI should look something like this:

Outbound (10)								
10	Internet	net_172.30.1.0_24	Internet	* Any	* Any	* Any	WorkforceAI	N/A
10.1		net_172.30.1.0_24	Internet	* Any	Workforce AI Supp...	Upload Traffic UK IBAN	Drop	Detailed Log Per Connec Per Session
10.2		net_172.30.1.0_24	Internet	* Any	Web Browsing dns	* Any	Accept	Log Accounting
10.3	Cleanup rule	* Any	* Any	* Any	* Any	* Any	Drop	None

- a.
9. Publish and install the policy.

Lab exercise 4: Testing the effectiveness of Workforce AI

Now that we understand the firewall requirements in terms of HTTPS Inspection, software blades and policy structure, we can proceed to testing Workforce AI security.

By the end of this exercise you should have proven that Workforce AI security in the firewall can prevent the leakage of personally identifiable information to SaaS AI platforms.

10. Return to the **Branch-Win10** VM, either via MobaXterm RDP on HQ-win10 or via the tab in the top.
1. Open an explorer window, navigate to the Documents folder and open the file “test prompt.txt”
 - a. In Notepad read the file and see that it contains python code, but does not have a complete python script. This code happens to check for the existence of a file path.
 - b. Select all text using CTRL+A, and then use the mouse right-click to copy the text.
2. Open Chrome and browse to **gemini.google.com**
 - a. Using the mouse right-click action, paste in the text that you copied.
 - b. Submit the prompt.
 - c. The prompt attempts to submit, and you should see the activity animation  displayed below the prompt.
 - d. After a short while the screen will return to the starting state, with the prompt ready to submit.
3. Return to the **HQ-Win10** machine and to SmartConsole.
 - a. Click on the Logs & Events tab. Filter the logs for blade:”Application Control” and find a Drop log:

Time	Origin	Source	Source User...	Destination	CIDR	Service
Today, 5:45:55 PM	branch-gw	Branch1-win10-ipv4 (1...		lcmiaa-aq-in-...		https (TCP/443)
Today, 5:44:36 PM	branch-gw	Branch1-LNX-ipv4 (172...		91.189.91.62		http (TCP/80)
Today, 5:43:21 PM	branch-gw	Branch1-win10-ipv4 (1...		142.251.156.2		https (TCP/443)
Today, 5:34:20 PM	branch-gw	Branch1-win10-ipv4 (1...		142.251.157.2		https (TCP/443)
Today, 5:28:48 PM	branch-gw	Branch1-win10-ipv4 (1...		142.251.215.4		https (TCP/443)
Today, 5:28:06 PM	branch-gw	Branch1-win10-ipv4 (1...		35.190.80.1		https (TCP/443)

- b.
- c. Inspect one of the logs. There are several interesting details shown:

d. 

The screenshot displays the 'Log Details' interface for a blocked access event. The event is titled 'Drop' and indicates that 'Branch1-win10-ipv4 (172.30.1.70)' was blocked access to Google Gemini Today at 5:43:21 PM. The interface is divided into several sections:

- Log Info:**
 - Origin: branch-gw
 - Time: Today, 5:43:21 PM
 - Blade: Content Awareness, Application Control, AI Security (highlighted with a red box)
 - Product Family: Access
 - Type: Session
- Application / Site:**
 - Application Name: Google Gemini
 - Primary Category: Artificial Intelligence (AI)
 - Additional Categories: Medium Risk, Artificial Intelligence (AI), Workforce AI Supported App, Text & Language
 - Application Risk: Medium (highlighted with a red box)
 - Application Description: Google Gemini is a conversational AI chatbot developed by Google, designed to provide advanced natural language understanding an... (with a 'more' link)
 - Client Type: Chrome
- File Operation:**
 - Data Type: Source Code - Python (highlighted with a red box)
- Https Inspection Details:**
 - Action: Inspect
- Traffic:**
 - Source: Branch1-win10-ipv4 (172.30.1.70) (highlighted with a red box)
 - Destination Country: United States
 - Service: https (TCP/443)

Exercise 4 is now complete, and we have shown that the AI Network Firewall is able to block communications containing Corporate Intellectual Property.

Summary

The AI Network Firewall functionality of Check Point R82.20 has been configured and tested to show that by integration with Workforce AI, it is able to prevent leakage of confidential information to commonly-used AI services.
